

# Einstein's velocity addition

("Zur Elektrodynamik bewegter Körper", Ann. Phys. 17 (1905), 891-921):

@ p. 906:

$$U = \frac{\sqrt{v^2 + w^2 + 2vw \cos \alpha - \left(\frac{vw \sin \alpha}{c}\right)^2}}{1 + \frac{vw \cos \alpha}{c^2}}$$

dimensionless:

$$\frac{U}{c} = \frac{\sqrt{\frac{v^2}{c^2} + \frac{w^2}{c^2} + 2\frac{v}{c}\frac{w}{c} \cos \alpha - \left(\frac{v}{c}\frac{w}{c} \sin \alpha\right)^2}}{1 + \frac{v}{c}\frac{w}{c} \cos \alpha}$$

which is:

$$\beta_0 = \frac{\sqrt{\beta_1^2 + \beta_2^2 + 2\beta_1\beta_2 \cos \alpha - \beta_1^2\beta_2^2 \sin^2 \alpha}}{1 + \beta_1\beta_2 \cos \alpha}$$

Note:

$\{\alpha, \beta_0, \beta_1\}$  observed in stationary frame,  
 $\beta_2$  in frame moving at  $\beta_1$  in stat. frame.

**Parallel:**

$$(\alpha = 0) \Rightarrow \beta_0 = \frac{\sqrt{\beta_1^2 + \beta_2^2 + 2\beta_1\beta_2}}{1 + \beta_1\beta_2} = \frac{\beta_1 + \beta_2}{1 + \beta_1\beta_2}$$

**Perpendicular:**

$$\left(\alpha = \frac{\pi}{2}\right) \Rightarrow \beta_0 = \sqrt{\beta_1^2 + \beta_2^2 - \beta_1^2\beta_2^2}$$

## Lorentz factor:

$$\gamma = \frac{1}{\sqrt{1-\beta^2}} \therefore \gamma^2(1-\beta^2) = 1 \therefore \gamma^2 - \gamma^2\beta^2 = 1 \therefore \gamma^2 - 1 = \gamma^2\beta^2$$

$$\therefore \beta^2 = \frac{\gamma^2 - 1}{\gamma^2} = 1 - \frac{1}{\gamma^2}$$

## Perpendicular velocity addition:

$$\beta_0 = \sqrt{\beta_1^2 + \beta_2^2 - \beta_1^2\beta_2^2}$$

$$\gamma_0 = \frac{1}{\sqrt{1-\beta_0^2}} = \frac{1}{\sqrt{1-\beta_1^2-\beta_2^2+\beta_1^2\beta_2^2}} = \frac{1}{\sqrt{1-\left(1-\frac{1}{\gamma_1^2}\right)-\left(1-\frac{1}{\gamma_2^2}\right)+\left(1-\frac{1}{\gamma_1^2}\right)\left(1-\frac{1}{\gamma_2^2}\right)}}$$

$$= \frac{1}{\sqrt{1-1+\frac{1}{\gamma_1^2}-1+\frac{1}{\gamma_2^2}+\left(1-\frac{1}{\gamma_1^2}-\frac{1}{\gamma_2^2}+\frac{1}{\gamma_1^2}\cdot\frac{1}{\gamma_2^2}\right)}} = \frac{1}{\sqrt{\frac{1}{\gamma_1^2\gamma_2^2}}} = \gamma_1\gamma_2$$

We have:

$$E_{\text{tot}} = \gamma mc^2$$

hence:

$$\gamma = E_{\text{tot}}/mc^2$$

which physically is:

dimensionless specific energy  
(i.e. energy per mass).

For perpendicular motions,  
the total specific energy is the  
***product*** of the individual values!

$$\gamma_0 = \gamma_1 \gamma_2 = \frac{E_{\text{tot},1} E_{\text{tot},2}}{m_1 m_2 c^4} = \frac{(E_{\text{kin},1} + m_1 c^2)(E_{\text{kin},2} + m_2 c^2)}{m_1 m_2 c^4}$$

**Parallel:**

$$\beta_0 = \frac{\beta_1 + \beta_2}{1 + \beta_1 \beta_2}$$

**perpendicular:**

$$\beta_0 = \sqrt{\beta_1^2 + \beta_2^2 - \beta_1^2 \beta_2^2} \quad \& \quad \gamma_0 = \gamma_1 \gamma_2$$

suffix 0: object's velocity w.r.t. stationary observer;  
 suffix 2: object's velocity w.r.t. some moving ref. point  $P$ ;  
 suffix 1:  $P$ 's velocity w.r.t. stationary observer  
 (consistent with the aforementioned, but 1 & 2 are of course interchangeable).

$$(\beta \rightarrow 0) \Leftrightarrow (\gamma \rightarrow 1) \quad (\beta \rightarrow 1) \Leftrightarrow (\gamma \rightarrow \infty)$$

If  $\{\beta_1, \gamma_1\} \rightarrow \{1, \infty\}$  then  $\{\beta_0, \gamma_0\} \rightarrow \{1, \infty\}$  totally indep. of  $\{\beta_2, \gamma_2\}$

**The more an object's velocity w.r.t.  $P$  approaches  $c$ , the more its velocity w.r.t. stat. obs. approaches  $c$ , i.e. the more its velocity becomes absolute, namely  $c$ .**

# Relativity yields absoluteness...

## Lorentz contraction of a moving object:

$L$  := length of moving object, measured in direction of motion;

$$L_{\text{seenByStationary}} = L_{\text{seenByComoving}} \sqrt{1 - \beta^2}$$

If *you* are speeding, then from *your* perspective the street is moving, hence contracted by the same factor  $\sqrt{1 - \beta^2}$ .

**The faster you go, the shorter the street appears to you**  
(cf. light experiencing zero time and distance).

**Ever realised that street extends to "EDGE" of COSMOS?**

**Would you reach the speed of light,  
then you would — *at this very speed of light* —  
instantly smack against the "edge" of the universe!**

*(Whatever the latter might be).*

**Special Relativity** presumes *symmetry*, both observers are equally equal.

**This premise implies the evident but *implicit* assumption**

that **YOUR** speed w.r.t. **ME**, as measured by **ME**  
 equals **MY** speed w.r.t. **YOU**, as measured by **YOU**.

$$v_{me} = \Delta L_{me} / \Delta t_{me} = \Delta L_{you} / \Delta t_{you} = v_{you}$$

(suffix means *observed by*, in hir own frame).

**We usually take for granted**

that **YOUR** speed w.r.t. **ME**, as measured by **YOURSELF**  
 equals **YOUR** speed w.r.t. **ME**, as measured by **ME**  
**AND MY** speed w.r.t. **YOU**, as measured by **MYSELF**  
 equals **MY** speed w.r.t. **YOU**, as measured by **YOU**,

**which inevitably renders *Lorentz contraction*:**

**due to time dilation, moving observer perceives shorter distance.**

**Would we however *reject* this *presumption we merely took for granted*,**

then both perceive the *same length* of the street, but the traveller needs less time as perceived by himself, so *(s)he* perceives *hir own* velocity as way larger than how the *stat. obs.* perceives it. From hir own perspective, (s)he could go way faster than the *speed of light*! It is called *celerity* and it equals:  $\Delta L_{stat} / \Delta t_{mov} = \gamma \beta c$ .
